Psiloc Extended Log

This application extends the possibilities of the build-in Log which collects the information about phone connections. It also gives much more possibilities, especially enables current cost calculations.
Extended Log contains independent modules **Reports** and **Billing scheme**.

Billing scheme is responsible for calculating the costs of the phone calls. It is possible if the user's cost plan by the GSM provider will be properly described inside the **Billing scheme**.

The phone connection cost can depend on the following:

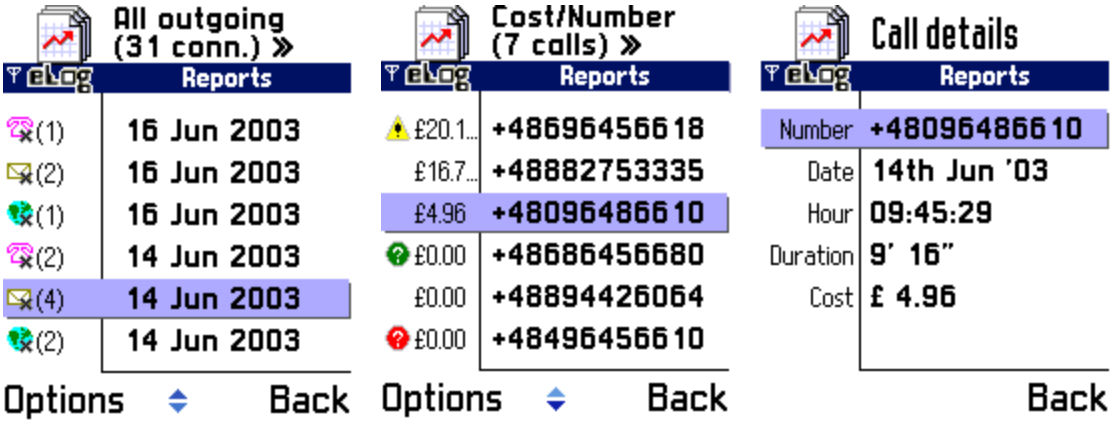

- Connection date – day type (public holiday/ weekend/ work day)
- Connection hour – time interval (hours from – to)
- Selected phone number (own network/ other network/ cable network and also own 'favorite' (discounted) numbers of friends, family, coworkers)
- Various promotions (like free minutes, special numbers)
- Cost plan which depends on the call duration (ie. first 60 seconds costs 1€, next 30 seconds of the same call costs 50 cents and every next second only 1 cent)

Such detailed information is available for every GSM network subscriber, so if they will be carefully rewritten to the **Billing scheme** the sum for the bill will be known before the provider will start to write it!
Naturally, **Extended Log** shows also a current state of the bill, currently used amount of free minutes etc.

Reports enables viewing collected information about the outgoing connections filtered or sorted according to the following criteria:

- Connection date
- Call duration
- Selected phone number
- Connections costs (counted by **Billing scheme**)

Reports enables counting connections, also filtered on:

- Phone number
- Date interval
- All connections

All reports can be sent to the PC to analyze them in any spreadsheet.
