Enhanced Log (eLog)

eLog represents an enhancement of the Logs appplication built into a telephone to record data on the connections made.

eLog consists of an independently working report module and billing module which extend the generated reports by calculation of the costs of the connections.

The **reporting module** ensures:

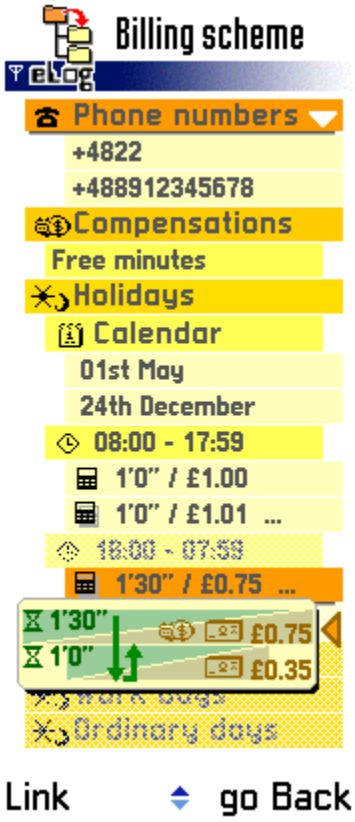

- long-term accumulation of Log data
- viewing on the telephone set display or export to a text file (CSV format) for further review on a desktop computer
- reporting by:
  - connection start date and time
  - connection duration
  - selected telephone number
  - connection count
  - connection cost (calculated by the billing module)

The above mentioned **billing module** is able to calculate the costs of telephone connections. This operation is possible due to the structure of rating plan of a given telephone network operator saved in the memory of the device.

The telephone connection costs are determined by:

- Connection date – day type (holiday/weekend/business day)
- Connection time – time of a day (from – to)
- Dialed telephone number – (within the same network/outside the network/residential network and selected numbers of family members/friends/business)
- Promotions offering discounts (e.g. free minutes, special numbers)
- Price list of specifying rates by connection duration (e.g. first 60 seconds costs 1€, following 30 seconds of the same connection cost 0.50€ and each following second only 0.1€)

Such detailed information can be available to each subscriber of a telephone network. If it is carefully mapped in the billing module, the bill amount to pay will be known before the operator sends it to the customer!
